

Sea Minerals - The Key to Replenishing the Soil

We are all familiar with ocean water, since it covers 70% of the planet's surface. However, most people assume that ocean water is merely "salt water". This is far from a complete truth. Ocean water is a solution rich in a wide range of minerals both macro and trace.

After centuries of studying the oceans, scientists have yet to develop a full grasp of the chemistry and workings of these oceans. What *has* been identified is that nearly every naturally occurring element is contained within these waters.

The incredible and varied range of elements in perfect concentrations has ensured that the oceans contain the greatest quantity of life forms on the planet, from the smallest and most delicate, to the largest and most powerful creatures to ever grace this Earth. This includes sea-living, beautiful mammals that actually breastfeed and have the capacity to show love and empathy for one another, no less than man himself. **How incredible is that?**

Sea Minerals are fit for all life, especially the soil. This wonderful source of nutrition is not only highly suitable for man and other creatures. It is also fit for the Earth itself. The reason that ocean minerals are so good for the Earth is because the minerals in ocean water actually come from the earth, from its surface and even from within her as they are forced up by unimaginable force through volcanic activity. Each year billions and billions of tons of minerals find their way into the oceans as they are jettisoned into our seas and oceans via our rivers and waterways.

The secret in replenishing the soil does not lie with a few isolated minerals combined with nasty chemicals (chemical fertilizers). It lies in the oceans, which happens to be the place that they all slowly end up in. If you owned a cow that wandered from you, would it not make sense to fetch it back, rather than leave it behind? The same should be done when the mineral goodness vanishes from your soil. **You should go and get it back!**

All minerals extracted through harvest or lost due to the forces of nature eventually find their way to the sea through our waterways. Once they find their way to the sea these minerals are suspended in a perfectly balanced mineral rich solution found nowhere else on earth. In the late 70's, a farmer named Gerry Amena did the sensible thing. **He went and got his minerals back.**

Until recently, the demand for sea minerals for human nutrition took up most of Gerry's time. Through a unique partnership and a number of trusted associates in the United States, Europe, and Asia, Gerry is able to supply every corner of the globe with his amazing agricultural grade sea minerals GroPAL.

Now everybody can utilize **low sodium** ocean nutrients on their farming operations and enjoy greater yields, greater profits and a lot more pleasure from the land. This is Gerry's secret.

Now it's yours.
